Application/Control Number: 10/775,144 Page 2

Art Unit: 1725

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).
- 3. Claims 3-10 are rejected under 35 U.S.C. 103(a) as being unpatentable over applicant's admitted prior art as set forth in page 1 of the specification and further in view of JP 2002-104,130 for the same reasons as set forth in the last office action.

Namely, the admitted prior art shows that it is conventional to form a complex cooling pores in a cooling structure of a gas turbine through a very difficult machining process. However, JP '130 shows that pores of desired orientation can be formed *in-situ* through a directional solidification process. It would have been obvious to form the pores of the conventional cooling structure of the gas turbine with the process of JP '130 to simplify the manufacturing process and thereby reduce the manufacturing cost. It is conventional to form a directional

Art Unit: 1725

solidification structure through the floating zone melting process (see, for example, US 4,934,446 to Winter et al. or US 2005/0145364 to Nakaiima).

- 4. Applicant's arguments filed March 19, 2007 have been fully considered but they are not persuasive.
 - a. Applicant's main argument is that the cited prior art does not show to control the cooling of the sheet metal such that the solid/liquid interface form an oblique angle with respect to the traveling direction of the solid/liquid interface. However, in [0011] as well as figures 3(a)-3(d) of JP '130 they show that the traveling direction of the solid/interface is perpendicular to the cooling surface, i.e. the traveling direction of the solid/interface is perpendicular to the heat removing direction. In figure 3(c), it clearly shows that the heat is withdrawn by the cooling means 25 and by the conduction of solidified metal. The vectors of these to withdrawal directions form a resulting vector which is oblique with respect to the traveling direction of the solid/liquid interface. Thus, the solid/liquid interface, and thereby the pores growth direction, form an oblique angle with respect to the solid/liquid interface traveling direction.
 - b. In page 8, second paragraph of the amendment applicant stated that the porous metal of prior art references does not provide the desired cooling performance and the desired heat insulating performance that can be realized by controlling the pore diameter and the porosity by controlling the atmospheric gas pressure and the solidification speed. However, as taught in [0019] of JP '130' the direction, size, density, etc. of the pores can be controlled by the process

parameters, such as the melt temperature, the solution temperature, the coagulation gas pressure, cooling temperature, the coagulation cooling rate, the mixed volume ratio, and the inert gas pressure. Thus, JP '130 does show to control the process parameters such that to control the pore size, pore density, and pore orientation, etc. The thermal properties of the directional solidification product of JP '130 vary depending on the resulting pore configuration. Thus, when the gas turbine part of the applicant's admitted prior art is manufactured with the process of JP '130, the part will provide the desired thermal properties.

5. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

6. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Kuang Y. Lin whose telephone number is 571-272-1179. The examiner can normally be reached on Monday-Friday, 10:00-6:30,.

Application/Control Number: 10/775,144 Page 5

Art Unit: 1725

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Patrick J. Ryan can be reached on 571-272-1292. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
